
h-spike: cells simulated from the reference, processed identically
state means, sd
Counts, cell annotations, gene positions
a
Filter genes; depth-normalise; log transform
b
Subtract reference mean; smooth along chromosome
c
Centre each cell
d
Subtract reference again; to fold change
Leiden subclusters
i6 HMM per subcluster
f
Bayesian filter: drop CNVs with P(normal) > 0.5
e
Denoise (display only)

a log-transformed expression
b reference subtracted, smoothed
c centred per cell
